

- `FILTER(Sales, Sales[Amount] > 1000)` returns a table of rows from the Sales table where the Amount is greater than 1000.
- `ALLEXCEPT(Sales, Sales[Region])` removes all filters from the Sales table **except** the Region column, while `ALL(Sales)` removes **all filters** from the entire Sales table including Region.
- `ALLSELECTED` returns all values that are currently **selected by the user**, including filters from slicers, but **preserves** filters applied at higher levels in a report like pages or visuals.
- `ALLSELECTED` might behave unexpectedly in a pivot table because it takes into account **both slicers and row/column context**, which can lead to confusing results when totals do not match expectations due to layered filters.
