

- A primary key is a column (or combination) that uniquely identifies each row in a table.
- One-to-many and many-to-many.
- By dragging a field from one table to a matching field in another table in Model view, or using "Manage Relationships".
- A star schema is a data model with a central fact table connected to dimension tables.
- The Sales table.
- Because it links each sale to a product listed in another table, typically the Products table.
- It reduces query complexity and improves performance by simplifying joins.
- Remove or redesign one of the relationships, possibly using DAX functions like `USERELATIONSHIP`.
- When both tables need to filter each other, such as in reporting involving many-to-many relationships or shared dimensions.
